TechnoSosioEcono Optimized Processes

FinLex DataBase Era

How to get things done without huge overhead
and without unnesessary risks?
Case collection!

Potkonen Ari

October 25, 2026

PREFACE

From the beginning for the 150 peoples size societies management evolutionally grown and developed human brain, with the ink, pen, and press printed paper created laws[5], managed original processes, do not scale correctly just by digitalizing the law book[8] and papers used to use, before digital technologies have been introduced. Now we have done a lot, not just digitizing old, but really dititalizing the information flows needed. Still there is lot of process habbits, which do not tolerate daylight, if we seriously look those from use case's User Experience (UX) perspective, or from overall society costs perspective, nor just from one government payment accounts perspective.

As part of my 356 days sliding window based Daily Tax™[10] (DTax) proposal creation and government politics follow up activities, comes up several bad SosioEconomical processes. I now decided to create own use case list from User Experience (UX), so that there is possibility to keep things in separate documents, and not just vomit nauseating UX cases to one document withing DTax™ proposal.

In this document created examples will bring up visible the overall process overhead compared to the digital era TechnoSosioEconomically optimized processes. Visibility it brought up by counting price for the government account unvisible work, time and other resources usage.

Idea is bring up painpoints to discussion from overall process optimization and related mandatory law change needs. The outdated laws start to be the root cause on many optimization cases way.

Sincerely yours Ari Potkonen

Part I

Valuation

Chapter 1

Peoples resources valuation

When costs are evaluated from certain government organization perspective then total cost is easily narrow mindedly defined, not takaing into account the tax paying customer own resources; money, time, space, facilities, technology and related peoples, like relatives time and resource usage. It does not either count risks, ecological and psycological stress generated due risks in these processes.

1.1 Security risks valuation

Each strong electronic identification means reliable verification of the identity online. This verification process inludes psycological and technological risks to be manipulated, misused then allowing abuse, exploitation valueble to entire value of property assets person has and even more, based to other persons name taken debt and

purchases adding this debt. It depends a bit from laws each country has, but any way, even risk is low, values what could be lost are big for the person under possible attac.

So when counting a risk and stress, it is much more expensive to demand person book an appointment from system you has to use strong electronic identification[12] than send a link to email activating this appointment booking for person without strong identification into system.

1.2 Used time valuation

When our leaders do different kind of services optimization it's quite often partial optimization from they own perspective, in detail from they own cost center payout perspective. It's really poorly optimized scenation from whole society perspective. Therefore we want to give at least some number values for the customer – citizen resources usage. We give kind of worktime, table 1.1 on page 5, or benefit time, table 1.2 on page 6, valuation for used time, because it's time customer could use othervise, for example to work, therefore these hourly values are digged out.

Statistics from hourly wage

To get the working age citizen time some value, we could use the average finnish hourly wage which is about 23€/h. Related professional roles participating to overall process can be valued according the statistics found from table 1.1 on page 5.

Year	Classification of Occupations 2010	Average for total earnings of wage and salary earners, EUR per hour	Median for total earnings of wage and salary earners, EUR per hour
2024	SSS Total	22.93	20.21
2024	221 Medical doctors	52.76	50.19
2024	226 Other health professionals	33.49	30.70
2024	2262 Pharmacists	30.78	29.90
2024	2423 Personnel and careers professionals	29.31	27.54
2024	26351 Social workers, etc.	25.44	25.20
2024	3141 Life science technicians (excluding medical)	19.59	19.00
2024	32211 Nurses	21.66	21.01
2024	32212 Public health nurses	20.02	19.78
2024	3258 Ambulance workers	23.04	23.21
2024	34121 Social instructors	20.07	19.52
2024	8322 Car, taxi and van drivers	...	...
2024	8331 Bus and tram drivers	20.13	19.78

Work requirement	8.31€/h
Guarantee pension	5.76€/h
General support	4.65€/h
Basic support	3.36€/h

Table 1.2: Governance set values 2026

Government definitions from hourly values

1.3 Physical presense valuation

When person is directly on inderectly required to be physically in place there is transportation and timewise related costs. Depending from the person situation transportation costs start from 0.1€/km by walking or by bicycle to 2€/km level when needing special car and person to help. All needed participants time has to be counted as worktime, because they do customers mandatet or indirectly forced task to get things done right.

Part II

Cases

Year	75 - 79 Population 31 Dec	80 - 84 Population 31 Dec	85 - Population 31 Dec
2025	314913	189759	170776

Table 1.3: Number of over 75 year old citisens at 2025

Environment respecting TechnoSosioEconomic optimization is needed [7] to get the processes running on time at the price we can afford. To ge the understanding what kind of changes in processes, protocols, law making etc. is needed.
And it's good to remember that diginative citizens "digizens" are young. Most society service users are old, in Finland table 1.3 on page 9 listing total 675448 of them. For most of the they only really actively used digital service is Digita's Digital Video Broadcast (DVB)[1] when they watch TV and use remote control.
We has to direct our efforts towards processes which are as easy to use as watching DVB TV.

Chapter 2

Health service processes

2.1 Prescription recipe renew

Many especially older peoples have medicine[9] prescription for long term health issue[6]. These prescriptions and medicine retrival data is stored to Kanta-database[2]. It's same database where epicrisis and laboratory[4] results are stored. It's somehow amazing to see that there is no automatic prescription recipe reneval for used medicines not requiring follow up, and ontime automatic laboratory referral sending from medicines, requiring up to date followup, for prescription reneval. Which then automatically reneved after resuls are arrived to Kanta-database. Usually wellbeing services county is avare from they own customers, and be able request nurse to take laboratory samples from customer.

As we can see, well done service process digitalization is mostly in-

visible. It's not requiring to use strong authentication through internet nor request through occupational health services.
Now current situation is that elederly people who relatives is used to pick medicines from pharmacy, and parmacy informs it be the last set in prescription, can ask prescription reneval from pharmacy if community doctor has written the prescription, but it's not accepted this way, elderly people has to come personally in place to ask the prescription reneval.
Peoples having prescriptions from occupational health services has to ask reneval from occupational services or by electronically requesting reneval from Kanta-database services. It's not either automatic nor renovable trough pharacy, even paharmacy hast prescription list open from Kanta-base. Needed laboratory referreals are not automated nor informed either in this pharmacy session.
This poorly optimized service digitalization is expected to cost as much of customer value, from this semi-optimized situation, that it's seen as business opportunity for commercial service[13]. Commercial service is expected to generate enough revenue from easing peoples lives, to make it profitable business from these issues and possibbilities to add prescription reneval, dosage services; vaccination, other medicine injection, and perhaps laboratory sample take and delivery services to pharmacy locations.
Commercial on pharmacy premises service could be handy, but it does not make the basic process any better, it just make it more executable at customers expense, still leaving process inbuild inefficensies in place where those could be removed.

FinLex DB Era

This booklet is central DataBase (DB) time diginatives User eXperience (UX) case collection, from processes and law making originally designed for the peoples having capability to remember 150 other community member peoples, have calandar, pen, and some paper for notes and some community forms, but may not have own clock, newspaper, network connection nor active devices on internet.

This case collection lifts some widely used basic processes to the table, to be seen and counted the price of existing setup, and then comparing it to technososioeconomically-optimized diginatives version of it, to point out how ridigilously we have costly overhead in some basic processes, we run widely in our society.

It might be that current law, designed for the small communities, demanded this kind of operation, where all memory was on members head and on some papers. We are living the era of fast digitalization, where all citizens after forthcoming, next 25 years, are basically somekind of diginatives, born after first digital calculators about 1975, being now 50's and 2050 about 75.
